## TIREMAAX<sup>®</sup> PRO

### Tire Pressure Control System

Tire pressure issues are a leading cause of commercial trailer breakdowns, accounting for up to 48 percent of road service calls. Under-inflation is a critical tire-related concern, contributing to up to 85 percent of blowouts and often leading to tire structural damage and / or reduced tire life.

Over-inflation, often due to elevated tire operating temperatures combined with increased ambient air temperature, can result in tread damage and irregular wear. Mismatched air pressures in dual tires, a condition found on roughly 25 percent of trailers, often leads to uneven load distribution and premature wear.

Effective tire pressure management is essential for efficient operation, tire longevity and reduced maintenance costs. TIREMAAX<sup>®</sup> PRO delivers a complete solution by automatically inflating, relieving and equalizing tire pressure, assisting fleets with road readiness and reduced downtime.
